

## PolicyGuru® Meta-Policy Controller v2.6.2 Release Notes

### Knowledge Base Article #PG4781

#### Synopsis

This document contains important information about PolicyGuru® Meta-Policy Controller v2.6.2. You must have v2.3.0 or later installed to upgrade to this version.

#### What's New in v2.6.2

- **Round-Robin capability for Load Balancing and/or Geo-Redundancy**—A Round-Robin capability has been added to the CAS Agent **DataProcessor** function. This new capability allows the configuration of two or more O1 endpoints within a **DataProcessor** to which Orchestra One Requests can be sent in a round-robin fashion. This provides load balancing and/or geo-redundancy for Orchestra One Requests.
- **Expanded Proxy Options**—The HTTP proxy capability added in v2.6.1 has been expanded to include optional use of HTTPS for encrypted tunnel setup and also the ability to use Kerberos Authentication, in addition to Basic Authentication.
- **Rule-based configuration for verifyANI.properties**—Rule-based “multi-config” processing has been extended to the **verifyANI.properties** file. This allows multiple AuthHub endpoints to be defined and requests to be sent to those endpoints based on the SEP Authentication rule that was fired.

#### Upgrade Instructions

The v2.6.1 upgrade instructions can be followed when performing upgrades to v2.6.2. The only package difference between v2.6.1 and v2.6.2 is that **slc-eip-1.0-74.x86\_64.rpm** (v2.6.1) has been updated to **slc-eip-1.0-75.x86\_64.rpm** (v2.6.2).

See the following articles in the SecureLogix® Knowledge Base for instructions for upgrading to v2.6.2 from a previous version:

- **Upgrading from v2.3**—<https://support.securelogix.com/article.htm?articleid=PG140>
- **Upgrading from v2.5**—<https://support.securelogix.com/article.htm?articleid=PG969>
- **Upgrading from v2.6**—<https://support.securelogix.com/article.htm?articleid=PG4761>

#### Configuration Instructions

See <https://securelogix.atlassian.net/wiki/spaces/PRDPG/pages/1314258985/CAS+Agent+Configuration+-+Frio+2.6.0+2.6.1+2.6.2> for CAS Agent Configuration instructions including Round-Robin, Proxy, and Rule-based **verifyANI** configuration instructions. 2.6.2-specific configurations can be found on this page by searching for “2.6.2”.

#### Known Issues in This Release

- **NGP-267**—SEP Rules using List names containing the string "then" anywhere in the name are misinterpreted by the PolicyGuru Rule Editor. Ensure that you do not include that string in a List name (for example, “authentication”).

- **NGP-264**—Upon startup of the ENUM Server or Metadata Probe, the first message related to Authentication processing, such as Authentication Requests on the ENUM Server or SIP Invites on the Metadata Probe, is not delivered up to the Mediation Server. This prevents Authentication processing from working on that call.
- **NGP-265**—Slow GUI responsiveness when selecting **Project Authoring** in the BRMS GUI. It sometimes takes 1 minute or more for the Rule Editor to become available.
- **NGP-207**—SIP Analytics limitation. Queries to gather SIP Analytics CDR data are limited to hour boundaries. In other words, if a call starts in one hour, but is connected or ended in a different hour, that connect and/or end information will not be available in the CDR information in SIP Analytics. This issue affects only the **Total Calls** and **Average CPS** views when you drill down to hourly CDR information, and calls are present that connect or end in a later hour. This is due to the fact that those views create the CDR display based on the given hour that you drilled into. Connect and/or End information that occurs in other hours will not be pulled in by the query over that hour.

To work around this issue and gather full CDR information, use the **Phone Number Analytics** view or other Call Detail views (**Call Disposition, Top 10 Source/Dest, Source/Dest by Country, Concurrent Calls**) because these queries do not use a predefined query time range. These views base their query on the user-specified date/time range. When using these views, ensure that your specified query date/time range encompasses the duration of the call to retrieve all parts of the call. For instance, if a particular call lasted two hours, the user-specified query range must include that entire two-hour range to include the End Time information.

- **NGP-206**—ENUM/ Analytics data mismatches at hour boundaries. Mismatches sometimes occur between the ENUM Analytics view counts and the associated CDR record counts, and a query for one specific hour may also show some graphed results for the next hour.
- **NGP-205**—**Source/Dest** country selection filter limitation in Analytics. Country filters for CDR data may return data for more than just the selected country if the search term is present in more than one country name.
- **NGP-174**—Rules with matching names except for case not displayed in Project View. In the Policy Rules editor, if there are multiple rules with matching names except for case, only one of the rules will be displayed. All rules can be viewed by using Repository View.
- **NGP-164**—List creation with initial listings creates duplicates in SEP policy on the ENUM Server. If listings are added to a list during the initial creation of that list, a duplicate value will be created in SEP policy on the ENUM server. The presence of the extra value in policy is non-service-affecting.

**Last Update:** 2/18/2021
